PICTOR®

As well as the CAMAT the PICTOR is a high performance smart camera that controls the production process robust, fast and reliable.

PICTOR is used as a stand alone or as a more camera based system (VICOSYS).

In difference to the CAMAT the PICTOR is calibrated and parameterized with the easy to use PC-Interface VCWin. Thus, a PC is needed this for. The numerical results of the extensive measurement- and test modules are sent to the production environment via RS232 or Ethernet.

Whether on the arm of a robot or at a fixed stand: PICTOR performs even under less optimal conditions. This robustness made the PICTOR a very popular vision system used all over the world to control the critical production processes.

The technical details can be found in the following data sheets:

- **PICTOR**
- **PICTOR M Sensors**

Features:

- Internal image analysis
- Fast measurement, testing and communication
- Stand-alone or more-camera-systems
- Control of production process via communication with PLC
- Variety of applications
- 4 digital I/Os
- 1 serial port or Ethernet instead
- Profibus as an option
- Teach-in with VCWin
