## Positioning

We offer high precision positioning systems for a proper feeding and processing of your products.

The current product is being checked and the general position is evaluated (whether it lies transverse, cross or straight). After that, the very position is measured and will be sent immediately to the PLC. Now either a robot can grip the product properly to put it into the needed position or the tool can be aligned to the right position in order to process the product.

Fast, reliable and 100%.

### Positioning tasks:

- Feeding
- Position evaluation
- Alignment of whether the tool or the product
- Sorting
- 2D and 3D
- Product database
